

3 to 5 months internship: Design of a thermal regulation for microfluidic chips

Design of a thermal regulation for microfluidic chips

Mission:

Design and fabrication of a thermal regulation stage for microfluidics experiments. The internship will happen in 3 steps: (i) design of a resistor pattern to warm up a microscope glass slide. The design can be checked by numerical simulations. This stage should also include a few temperature sensors (thermocouples or thermistors) to provide a feedback to the temperature controller. (ii) Design and programming of the temperature control feedback loop. (iii) Implementation of a user friendly interface to set the temperature and display the set value and the actual value.

Education required:

Student in M1 or M2 enrolled in a physics or engineering degree. The student can also be a 2nd or 3rd year engineering school (Grandes Ecoles) student.

Skills:

The candidate should be familiar with electronics design and microcontroller/Arduino programming. A knowledge of control engineering, microfabrication and finite element modeling is a plus but is not mandatory.

Place:

UMR1147 Translational research team
Centre universitaire des Saints Pères
45 rue des Saints-Pères
75270 Paris Cedex 06
France
